Note The ones we call "hotkeys" (shortcut keys) in this book are also referred to as "F1–F12." # Quick Review Photoshop includes 17 tools that you can use to create, edit, and manipulate your image. The tools are organized into four groups: Selection, Tools, Layers, and Image. Tools and Layers are located at the top-left and top-right corners of the window, respectively. The Layers panel, which is separate from the Tools panel, is at the bottom of the screen. The Image group is the workspace itself; it has a variety of tools that enable you to prepare and refine your images. Every image uses a default file type, which is used to define the appearance and behavior of the image; the file types that you can use are JPEG, TIFF, PSD, EPS, and PDF. The most commonly used file types for digital photography are JPEG and TIFF. Both file types have their advantages, and each has its own limitations. The TIFF file type is recommended for images that have a limited number of colors, such as black-and-white photos, because of its greatly enhanced compression abilities. For photos with a large amount of digital information, such as a high definition video, the JPEG format produces the best results. Although Photoshop's default file format is JPEG, you can save a file in a variety of other formats. Digital images have a _resolution_,

Striatal phosphorylation of protein phosphatase 2A and its regulation by dopamine. In the striatum, a high level of dopamine activates the cAMP-dependent protein kinase (PKA), which in turn phosphorylates the catalytic (C) subunit of protein phosphatase 2A (PP2Ac). This event is associated with the inhibition of PP2Ac and the stimulation of PP1. We now show that PP2Ac is also phosphorylated in the striatum, and that dopamine enhances its phosphorylation. When a synthetic peptide containing the major in vivo phosphorylation site of PP2Ac was assayed, dopamine specifically enhanced the phosphorylation of this site. The tyrosine kinase inhibitor genistein and the mitogen-activated protein kinase kinase inhibitor PD98059 blocked this stimulation. PP2Ac is an endogenous substrate for this kinase, and dopamine regulates its activity. We propose that dopamine increases PP2Ac phosphorylation by enhancing its tyrosine phosphorylation and by inhibiting the upstream kinase or phosphatase that blocks phosphorylation at this site.Q: Rails Rake jobs are not performing if background.queue_adapter is used If I use the background queue adapter to set up the jobs I want to run in a rake task in Rails like this: Rake::Task.define_task("queue:run_method_1") do puts "the queue is not full" Rake::Task.run_without_block puts "job ran" end Then it works fine when called directly. However, if I call queue:run_method_1 from a rake task like this: Rake::Task.define_task("queue:run_method_1") do # put the actual tasks in here end Rake::Task['queue:run_method_1'].invoke The puts lines are not being called. Are there any guidelines on this? Is this a bug, or am I missing something? A: This is not a bug in Rake. It is documented behaviour: Rake Tasks run asynchronously - when called, the task will immediately exit, returning nil. Consequently, when you call run, you want to ensure that any deferred code is executed BEFORE the Rake task exits:

Welcome to the eighth and final webinar in our series on PSA Testing. Previously, we covered PSA Screening – What You Need to Know and PSA Testing – the Basics. In this webinar, we're going to look at the risks and benefits of PSA Testing, how to decide whether to get tested, how tests are performed and who should get tested, and what the result of a PSA test means. PSA is the prostate-specific antigen – meaning, proteins, enzymes, and hormones are produced by the prostate gland. PSA is linked to prostate cancer but is NOT a cancer marker. High levels of PSA is not the same as prostate cancer. PSA is mainly produced by the prostatic epithelium, including the prostatic ductal and glandular epithelium, but the production of PSA from the epithelium of other organs, such as the testicles, bladder, and urethra, is not uncommon. PSA can be found in the urine of both men and women but is not usually found in the urine of women unless they are pregnant or have a condition called "hormonal benign prostatic hyperplasia," or they have prostatitis or prostatitis symptoms. PSA can be found in men up to and beyond age 70. If you don't have prostate problems but test high for PSA, you could have prostate cancer, prostatitis, prostatitis symptoms, an enlarged prostate, or prostate enlargement. PSA Testing before Age 50 – What You Need to Know Young men can have high PSA readings that don't lead to cancer or that're caused by another health condition, such as prostatitis or a nonmalignant condition, such as benign prostatic hyperplasia (BPH). PSA Testing after 50 Increased PSA levels occur in men of any age, but the older a man is the more likely he is to be diagnosed with prostate cancer. Men over age 50 have lower levels of PSA because prostate volume decreases and fewer PSA-producing cells are present. Therefore, men over age 50 may need a higher level of PSA to be screened for prostate cancer. If PSA Testing is performed, men are more likely to be diagnosed with prostate cancer after age 60, and men over age 70 may have increased risk of metastases (cancer that has spread). Many men over
